

UX Visual Design Requirements

1. Purpose

Create a visual mock up for a blockchain scam detection chat application.

The application should have a modern conversational AI interface similar to AI's like ChatGPT, where users can enter blockchain related questions and receive scam risk information and explanations in a clear, text-based format.

The design should focus on simplicity, readability, trust and ease of use.

2. General Visual Style

The interface should:

- Have a clean and modern appearance.
 - Use a simple conversational/chat-based layout.
 - Feel professional and trustworthy.
 - Avoid overly technical or cluttered dashboard designs.
 - Use consistent spacing, typography, buttons and components.
 - Clearly distinguish user messages from assistant responses.
 - Present blockchain information in an understandable format.
 - Use text to communicate relationships between blockchain addresses.
 - Maintain a consistent visual style across all screens.
-

3. Main Chat Page

The main page should be centred around the chat interface.

Display Elements

The mock-up should include:

- Application name/logo.
- Main conversation area.
- User message styling.
- AI/assistant response styling.
- Text input field.
- Send button/icon.
- New chat option.

The chat input should be visually prominent and easy to identify.

Example placeholder:

"Ask about a wallet, transaction, token or blockchain scam..."

4. Empty Chat / Welcome Screen

Before the user begins a conversation, the page should include a simple welcome state.

This may contain:

- Application name/logo.
- Short introductory message.
- Main chat input.
- Example questions or prompt suggestions.

Example suggestions:

- "Is this wallet suspicious?"
- "Check this address for scam activity."
- "Why is this address considered risky?"
- "What is a rug pull?"

The welcome screen should remain simple and should not overwhelm the user with information.

5. Scam Assessment Response Design

A scam assessment should visually stand out from a normal chat response.

The mock-up should include space for:

Overall Assessment

Examples:

Potential Scam

Low Scam Risk

Insufficient Evidence

Confidence

Example:

Confidence: 82%

The UX designer may represent this using:

- percentage text,
- a progress/risk bar,
- a status badge,
- or another simple visual indicator.

Risk Type

Example:

Risk Type: Rug Pull

The assessment, confidence and risk type should be easy to identify without requiring the user to read the entire response.

6. Evidence Section

The scam assessment should include a visually separate section explaining the evidence behind the result.

Example layout:

Why was this flagged?

- Large liquidity withdrawal shortly after pool creation.
- Suspicious interactions with previously flagged addresses.
- Unverified contract source.
- Unusual transaction activity.

The evidence section should:

- Be easy to scan.
 - Clearly separate individual evidence points.
 - Avoid large blocks of text.
 - Allow longer evidence lists without making the page cluttered.
 - Optionally use cards, expandable sections or bullet-style items.
-

7. Address Information Display

The mock up should include an example of how blockchain address information may be presented.

Possible information includes:

- Wallet/address.
- Blockchain/network.
- Recent activity.
- Transactions.
- Token information.
- Contract information.

Information should be organised into readable sections rather than displayed as raw technical data.

Example:

Address Information

Address: 0xABC...XYZ

Network: Ethereum

Recent Activity:

Sent 1.2 ETH to 0x123...789

8. Blockchain Address Styling

Blockchain addresses are long and should have a consistent display style.

The design should consider:

- Shortened addresses such as 0xABC...XYZ.
 - Monospaced or visually distinct text.
 - Copy icon/button beside addresses.
 - Full addresses available where appropriate.
 - Long addresses must not break the layout.
-

9. Chat Message Design

User and assistant messages should be visually distinct.

User Messages

Should clearly indicate messages entered by the user.

Assistant Messages

Should be visually separate from user messages and allow:

- Normal text responses.
- Headings.
- Evidence lists.
- Scam assessment cards.
- Address information.
- Warnings/notices.

The design should support both short and long responses.

10. Error Message Design

Create a simple reusable error style.

Examples may include:

- Invalid wallet/address.
- Unable to analyse request.
- Information unavailable.

Errors should:

- Be easy to notice.
 - Use simple language.
 - Fit naturally into the chat interface.
 - Avoid taking the user away from the main page.
-

11. Navigation

Keep navigation simple.

Suggested navigation:

- **New Chat**
- **Chat**
- **Settings**

A sidebar similar to conversational AI applications may be used.

The sidebar should not distract from the main conversation area.

12. Risk Visualisation

Risk should be clearly identifiable without relying only on colour.

For example:

High Risk — 87%

rather than only displaying a red indicator.

Possible levels:

- Low Risk
- Medium Risk
- High Risk
- Insufficient Evidence

The exact colour palette and presentation should be determined by UX.

13. Trust / Disclaimer Design

Because scam assessments are not guaranteed conclusions, include a subtle disclaimer area.

Example:

This assessment is based on available blockchain evidence and should not be considered definitive proof of fraudulent activity.

The disclaimer should be visible but should not dominate the page.

14. Responsive Design

The UX mock-up should consider:

Desktop

Primary layout showing:

- navigation/sidebar,
- chat conversation,
- message input,
- assessment responses.

Mobile

The design should show how:

- the sidebar collapses,
 - chat content fills the screen,
 - evidence sections stack vertically,
 - long blockchain addresses remain readable,
 - the chat input remains accessible.
-

15. Visual Edge Cases

The mock-up should account for:

Long AI Responses

The interface should expand naturally without overlapping elements.

Long Blockchain Addresses

Addresses should wrap or shorten appropriately.

Large Evidence Lists

Evidence should remain readable and organised.

Long Conversation History

The conversation area should support scrolling while keeping the message input accessible.

No Evidence Available

The layout should still appear complete without leaving awkward blank sections.

16. Required Mock-up Screens / States

The UX designer should create mock-ups showing:

1. Empty / welcome chat page.
2. Active conversation.
3. Scam risk assessment response.
4. Evidence / explanation section.
5. Blockchain address information response.
6. Loading / analysing state.
7. Error message state.
8. Desktop layout.

17. Main Visual User Journey

The mock-up should visually demonstrate the following journey:

Open application

- **Enter blockchain question/address**
- **View analysing state**
- **Receive risk assessment**
- **View confidence and supporting evidence**
- **Ask "Why?"**
- **Receive a text-based explanation**

The design should make this flow immediately understandable without requiring any network diagrams or complex blockchain visualisations.
